High Density Cleaners and Parts

Triosim can furnish new units as well as replacement parts for high density cleaners. High-density centrifugal cleaners reduce wear on the screens by removing pebbles, staples, grit, metal and other heavy contaminants from the stock. The cleaners are installed ahead of coarse and fine screens to remove contaminants with minimum fiber loss. Paper stock slurry enters the cleaner and heavy rejects fall to a removal trap. Cleaners can be operated continually at up to 4% consistency either as manual or automatic operations. These units can also be installed in front of refiners to reduce plate wear. Unique design uses ceramic linings combined with heat-treated 410 stainless steel fabrications and castings to increase wear life. Duco™ Scavenger valves with hardened seats are used for the reject chamber for improved performance.

- Ceramic lined
- Heat-treated 410 stainless steel
- Reduces wear
- Operates Continually 4% consistency
- Improved performance
